BRITISH MILITARY AERONAUTICS.—Now dirigible shed now in course of construction at Farnborough for the new British airship which will before long be ready for its house. In the background of the lower photograph the old airship sheds are seen. See special article, page 36.

A MORAL FROM FRANCE FOR BRITISH UNITY.

Time and time again have we urged upon all those who desire to see this industry take its proper place in the aeronautic councils of the world, the necessity of rallying solidly round the Aero Club of the United Kingdom and of lending their consolidated aid in making that body as thoroughly representative of the British Isles as it is possible for any national institution of the kind to be. Various reasons have been advanced for this course in these columns during the past twelve months, and it has been our constant endeavour to show why that parent body with its allies—the Aeronautical Society and the Aerial League—deserves and ought to be accorded the whole-hearted support and direct membership of every genuine supporter, or always of every individual who hopes to take any practical part whatsoever in the great work that lies ahead of them now at present. Possibly it is not too much to say, however, that never before has there been a more telling occasion than during the past few days when the absolute necessity for unity of action as between all those who would foster the British aeronautic industry has been exemplified in a specially striking manner and in a way that affects the whole future prospects of the United Kingdom in relationship to those of other European countries—and of France especially. Events have in fact transpired across the Channel in connection with the arrangement by the International Federation of a calendar of events to 1910 which seem to disclose a disposition on the part of our French friends to underrate the immediate situation of this country very considerably by regarding the British aviator as non-existent, not only now but for some little time to come, and by looking upon British aeronautic interests as being of but small account compared with those of France.

It must be admitted of course that we have a good deal of leeway to make up over here, and that is one of the principal reasons why enthusiastic energy urgently needs to be aroused at home; but apparently it is quite overlooked, or may perhaps be unknown to the foreigner, that inventors have been doing a vast amount of work of late in this country, even though they may not have been talking overmuch about it. And thus it is possibly hardly to be wondered at that the Frenchman has been inclined to complete his plans for the new year in advance, omitting to make proper allowance for activities in other countries. As we have already suggested above, however, it is an admirable thing for this country that it has had a strong representative body composed of men of experience in such matters, and not merely of fresh comers into the field with little more than enthusiasm to carry them through, and that the Aero Club of the United Kingdom has at this comparatively early stage in International aeronautical politics been able to take a firm stand. At the Conference of the past week in Paris the overwhelming importance of France appeared almost to have been sufficiently dazzling in the eyes of the Frenchman to have blinded him to the reasonable requirements of the other nations that take the lead in the civilised world. All the choicest dates throughout the coming season would apparently have been allotted cheerfully to those various towns in France that were keenly anticipating the promotion of big International meetings during the year. England, joined by Germany in particular, and backed up also by Denmark, was compelled to take a very firm stand indeed in order to prevent being outvoted at the Conference. As events turned out, the British Club was ultimately successful in upholding the rights of this country even though it involved a considerable amount of diplomacy and the adoption of an extremely firm attitude to bring the result about. But although it is satisfactory to be able to record that suitable dates were ultimately allotted to the United Kingdom for a meeting in July as well as for another in August, yet the main point that really concerns us here is one of principle and of policy alone. Here, in fact, we have a case in which any sign of weakness or of internal dissension on the part of this country might have done incalculable harm not only to our prestige in the eyes of other nations, but actually to the business prospects of the aeronautic industry for very many years to come. The risk, it will be observed, is that of permitting France during these earliest days when she has already acquired a useful start, to profit by that lead to the extent of using it for the purpose of maintaining it indefinitely. It is, in fact, quite bad enough that just at the present time anyone who needs a ready made power-driven aeroplane has a bigger selection from France than over here, and one of the principal reasons why institutions like the Aero Club are founded is in order to enable experimenters and builders at home to take their proper place immediately the progress made by them is sufficient to justify it.

Just in the same way that this question for the forthcoming season has brought the A.C.U.K. very much to the fore and has emphasised the necessity that there is for safeguarding it with the fullest possible authority to speak in the councils of the world, and to exercise real power as other events of the same kind may occur at any moment from now onwards, and a vast amount of harm be done if any display of weakness were at any time rendered unavoidable owing to national dissensions between one representative institution and another. The present, therefore, seems to be a particularly appropriate time to urge upon our readers the desirability of the efforts to be put forth by them for increasing the power wielded by the Aero Club of the United Kingdom and its allies. Hence we suggest that those who have not already joined the membership of one or other of those sporting, scientific, and patriotic societies, respectively, if not more than one of them, should send in their application forms at once, and should use their best endeavours to induce as many friends as possible to follow suit. Therein, for the immediate future at any rate, lies the road to progress for the aeronautic movement in Great Britain.

It is not, in fact, everyone who can at the moment lend a helping hand by carrying out experiments, by building machines or by popularising the science of flight. But there are plenty of all-British flyers, both on and off the stocks, of which a very great deal indeed will be heard between now and the time of the British July meeting; and we do not hesitate to say that the degree of satisfaction with which we and others who are interested in British aeronautics will be able to look back upon the present year at its close will depend largely upon the extent to which the membership of these three representative bodies increases in the immediate future.

FLIGHT PIONEERS.

MR. MORTIMER SINGER.

AERIAL PROPELLERS.

AND SOME POINTS WHICH MAKE THEM INTERESTING

Continued from page [illegible]

Thrust and Slip.

The primary condition which it must obviously fulfil is that of exerting a thrust (P) sufficient to overcome the resistance of the aeroplane in its line of flight. This thrust, [illegible] we can only be maintained by imparting a rearward velocity or slip (v) to [illegible] per second [illegible] the value of the thrust [illegible] by [illegible]. [illegible] word [illegible] ment [illegible] the pressure or thrust of the propeller [illegible] the mass of air which it acts on in [illegible] second [illegible] the real slip which it imparts [illegible] It will be observed however that increasing the speed [illegible] second [illegible] the mass [illegible] with [illegible] of the volume [illegible] It [illegible] expression [illegible] may be written $P = pAv^2$ from which the important deduction is made that whereas the thrust is only directly proportional [illegible] as the square of the speed of the slip.

"Disc Area."

For the above, the area may be assumed as equal to that of an imaginary disc attached to the boss of the propeller and having a diameter extending to the tips of the blades. As such a disc would have an area $\pi D^2/4$, it therefore follows that the propeller thrust is proportional to the square of its diameter.

In order to increase the thrust [illegible] it is [illegible] necessary to increase the [illegible] column of air [illegible] the revolutions [illegible] propeller [illegible]

Pitch of a Propeller

The pitch of a propeller is the distance [illegible] advance [illegible] the angle of the blades [illegible] in one revolution and for any given diameter it is therefore an indirect measure of the angle which the tips of the blades would make to the plane of a disc fastened to the propeller boss. Such being the case it does not require a very technical mind to come to the conclusion that the ratio between the pitch and the diameter can be [illegible] practical utility because of the churning action which would be set up by the blades if they were given too great an angle. If, for instance, they were set wholly at right angles to the imaginary disc they would not [illegible] propeller at all, but a churn pure and simple. At the other extreme, if the blades had no angle at all they would merely be equivalent to a disc revolving in a plane at right angles to the [illegible]. It can be [illegible] the intermediate value of 45° is the theoretical angle at which a blade should be set if working in fact [illegible], but the [illegible] adopted in practice are [illegible] far below this, and the exact value is a factor which depends upon the skill and experience of the designer.

This is an the point to be borne in mind too, and that is that the angle of the blade is neither constant from root to tip [illegible] leading edge to trailing edge. A constant blade angle from root to tip would [illegible] a variable pitch, and a constant blade angle from leading edge to trailing edge would produce a flat blade, which from the analogy of the aeroplane might well be assumed to be less efficient than one suitably cambered. [illegible] approximate reckoning it is sufficient now the mark to regard a propeller as [illegible] of a helix having such variations in blade angle as will produce a constant pitch in all diameters [illegible] of the propellers [illegible] for [illegible] practical considerations which cause a departure from [illegible] for example, [illegible] propellers like those now [illegible] of wood where the blade itself [illegible] does spring [illegible] mounted on a separate arm.

Wood v. Metal

In any propeller [illegible] blade [illegible] and there comes a point where the [illegible] may [illegible] efficiency [illegible] from this point to the boss it is the designer's chief object to reduce loss rather than to gain thrust, and thus it is that in metal propellers the blades are commonly cut away entirely where they cease to be efficient and are mounted on steel arms [illegible] which offer

[illegible]

The Short propeller is constructed entirely of wood and consists of six separate layers which are joined together to form a solid piece.

relatively small resistance to their passage through the air. In wooden propellers where the blade is a [illegible] part of the whole, constructional considerations [illegible] prevent any such cutting away as this and consequently [illegible] propellers [illegible] the blade gradually [illegible] across the boss, as [illegible] the boss.

Weight and Strength.

When considering a propeller [illegible] alone sufficient to have regard to its theoretical qualities for like all [illegible] practical mechanism considerations of weight and strength [illegible] Excess weight, for instance, is the principal factor which [illegible] the use of propellers of very large diameter and always where there is a question of weight concerned with a moving part, the question of strength has enhanced importance. On the [illegible] the designer's object is to use as large a propeller as possible without running up against any of the difficulties [illegible] his path.

"Cavitation."

There is one other consideration which is involved in an analysis of the equation [illegible] the thrust [illegible]

propeller and that in the effect of the revolving [illegible] [illegible] with a given pitch, the eating [illegible] will increase the speed of forward [illegible] [illegible] and with [illegible] effect up [illegible] [illegible]

In the Beetle propeller [illegible] blades [illegible] supporting by being [illegible] [illegible]

It seems that this [illegible] [illegible] [illegible] difficulty [illegible] [illegible] [illegible] would rather the design [illegible] propeller [illegible]

High and Low Speed.

Besides the question of strength, high speed [illegible] other difficulties which are well known [illegible] with mechanical apparatus. The moving [illegible] be particularly well balanced, and on an aeroplane the gyroscopic [illegible] has also to be taken into account [illegible] it interferes with the [illegible] of the propeller shaft due to sudden swerving of the [illegible]. Practical experience [illegible] day however seems to indicate that propellers can be satisfactorily operated at the [illegible] speed [illegible] and for the time being [illegible] likely to use them.

Efficiency

So far we have considered only one aspect of propulsion, that of obtaining the greatest possible thrust from the screw. It has been convenient to take [illegible] of the question by itself because by fixing the idea on one point [illegible] shown [illegible] relations which exist between what may be termed [illegible] of [illegible] propeller design. That [illegible] [illegible]

It has been shown [illegible] the [illegible] of a propeller depends [illegible] forward motion [illegible] velocity [illegible] [illegible]

The Best Propeller

[illegible] propeller [illegible] [illegible]

The [illegible] propeller is a wooden [illegible] [illegible]

The [illegible] [illegible] [illegible] propeller.

Some of the considerations which [illegible] of a propeller have already been discussed [illegible] some [illegible] found which affect the [illegible] speed, and pitch. This latter factor, however, has [illegible] be considered on its own efficiency [illegible] a limitation of the blade angle [illegible] [illegible] [illegible] free to adopt an efficient [illegible] [illegible] that if the diameter is also made as large as possible, the revolution speed will be the sole remaining factor by means of which the [illegible] can be adjusted [illegible] the thrust required.

(To be continued.)

Ae.C.F. Doings.

The Aero Club of France have decided to send three challengers to the Aero Club of America for the Gordon-Bennett Flight Cup, and they have also entered a full team for the Gordon-Bennett Balloon Cup [illegible] which will also be held in America this year.

It has been decided to present gold medals to Mr. Henry Farman for his duration and distance records, and to Mr. Hubert Latham for the [illegible] flights he has carried out on his monoplane, while silver [illegible] medals are to be given to MM. Maurice [illegible] and M. Jacques de Lesseps for their performances [illegible] country.

[illegible] certificates have recently been granted to the Hon. C. S. Rolls, MM. [illegible] MM. Jacques de Lesseps, [illegible] [illegible] Aubrun, [illegible] and [illegible] [illegible] pilot-aeronaut's certificates have been given to MM. [illegible] [illegible] and Louis Godard. [illegible] also has qualified for a balloon pilot's certificate.

BRITISH MILITARY AERONAUTICS.

ACTIVITY AT THE BALLOON FACTORY.

From Our Special Correspondent.

[illegible] with the control of the various departments associated with military aeronautics, [illegible] the appointment of a civilian, Mr. Mervyn O'Gorman—a well-known consulting engineer and automobile expert—to the post of Superintendent [illegible] Military [illegible] Factory. [illegible] Colonel Capper [illegible] in addition to his proper duties as Commandant of the [illegible]

[illegible] Capper [illegible] towards [illegible]

Now that the two departments [illegible] been separated, [illegible]

MONOPLANE *v.* MULTIPLANES.

By A. V. ROE.

At the recent Aero [illegible] Dinner the Hon. C. S. Rolls said: "It seems fairly certain that [illegible] the monoplane [illegible] will not [illegible]." When Mr. Rolls uttered these words he [illegible] English triplane [illegible] number of flights in July and August with only a [illegible] h.p. [illegible] engine, having two [illegible] stroke.

As far as the writer [illegible] monoplane [illegible] has ever approached [illegible] results, [illegible] speaks very [illegible] of the future possibilities of the triplane. At present the monoplane is undoubtedly the [illegible] graceful [illegible], but other things besides appearances must be taken into consideration. In my own efforts [illegible] are being devoted to producing a light handy machine, [illegible] the smaller and lighter the aeroplane [illegible] likely is the aviator to [illegible] himself to trust [illegible] when taking cross-country trips.

Naturally one would ask, "What are the advantages of the triplane?" Firstly, the triplane is only one-third the [illegible] of a monoplane, roughly speaking, [illegible] the same area, and consequently the aeroplane [illegible] reduced to [illegible] weight. As there is [illegible] the strains are reduced considerably and the angle of the wing is not so acute as [illegible] the monoplane [illegible] easily get a higher aspect ratio with greater cutting edge and thus gives greater lifting power per square foot of surface.

Monoplane enthusiasts say there is a loss of efficiency through super-imposing the planes, but [illegible] has been proved that for angles of less than [illegible] there is practically nil, when planes are not [illegible] apart. The [illegible] planes being narrow [illegible] be kept [illegible] and consequently they can carry the same weight per sq. ft. as main planes. The writer found his triplane aeroplane would not fly unless it carried the same weight per sq. ft. on all the planes, [illegible] the triplane [illegible] to [illegible] fitting the [illegible] wings [illegible] than a biplane of equal [illegible].

Stability is perhaps [illegible] aeroplane, and in this [illegible] mentioned about [illegible] conjunction [illegible]. At present the Avro [illegible] triplane holds the [illegible] for manoeuvring in rough weather and this I consider is greatly due to the dihedral angle of [illegible].

Perhaps [illegible] may consider the triplane unstable owing to my accident [illegible] but [illegible] making [illegible] the [illegible] speed [illegible] the wing [illegible] which by the way has [illegible] necessary to have [illegible] but [illegible] not enough and [illegible] vertical rudder to [illegible] the machine [illegible] speed on the falling [illegible] struck the ground heavily. Had the machine been a monoplane of same area and consequently greater span, [illegible] had [illegible] would have been still [illegible] and as the speed of the monoplane would have been travelling [illegible] than [illegible] smaller [illegible] plane.

Some pilots may think they have perfect control [illegible] after their [illegible] flight, but it seems to me a hundred flights are not sufficient to prevent the [illegible] of some little badge on [illegible].

As regards quadruplanes and multiplanes [illegible] still there is no doubt will come along in the near future, but each type necessitates a considerable amount of experimental work.

12½ Miles Up in the Air

MR. W. H. DINES, who [illegible] conducting some experiments in connection with the temperature of the upper atmosphere, was able to give [illegible] the result obtained with some small balloons equipped with registering apparatus. Eight such balloons were sent up from [illegible] Argyllshire, and three have been recovered, one near Oban, another [illegible] and [illegible] at [illegible]. Two of these reached an altitude of 12½ miles, and while the temperature at seven miles high at one reading of the instruments was [illegible] degrees F., at another it showed [illegible] degrees F.

Flying Over Lake Geneva

THE organisation of flying races across Lake Geneva [illegible] is now taking [illegible] and a [illegible] is being arranged to take place from [illegible] by [illegible] the [illegible] suggested being between [illegible] and [illegible]. The distance between the two landing places would be [illegible] kilometres, and in view of the fact that one is on Swiss territory and the other in France, the meeting would naturally assume an International character, the Aero Clubs of Switzerland and France sharing the responsibility of organisation.
